

**TABLE 2.2** Main structural and functional features of specific amino acids in proteins.

<b>Amino Acid</b>	<b>Structural and Functional Features in Proteins</b>
Glycine	<ul style="list-style-type: none"><li>• Confers flexibility to proteins</li></ul>
Proline	<ul style="list-style-type: none"><li>• Creates rigid kinks in proteins</li></ul>
Methionine	<ul style="list-style-type: none"><li>• Participates in weak polar interactions via sulfur's nonbonding electron pair</li><li>• Possible antioxidant</li><li>• Participates in enzymatic metal catalysis</li></ul>
Serine and threonine	<ul style="list-style-type: none"><li>• Important to regulation of protein and cellular functions via phosphorylation</li><li>• Important to solubility, protection and recognition of membrane and secreted proteins via glycosylation</li><li>• Act as nucleophiles in covalent catalysis in enzymes</li></ul>

Amino Acid	Structural and Functional Features in Proteins
Cysteine	<ul style="list-style-type: none"> <li>• Appeared late in evolution</li> <li>• Participates in weak hydrogen bonds and <math>\sigma</math>-<math>\pi</math> interactions</li> <li>• Binds metals covalently</li> <li>• Contributes to protein stabilization, protection, folding, and signaling via disulfide bond formation</li> <li>• Participates in signal transduction (farnesylation, palmitoylation)</li> <li>• Participates in enzymatic covalent, redox and metal catalysis</li> <li>• Antioxidant</li> <li>• Target of alkylating agents (toxins, lab reagents)</li> </ul>
Asparagine	<ul style="list-style-type: none"> <li>• Important to solubility, protection and recognition of membrane and secreted proteins via glycosylation</li> </ul>
Glutamate and aspartate	<ul style="list-style-type: none"> <li>• Interact electrostatically with cationic amino acids, ligands, and metals</li> <li>• Bind metals covalently</li> <li>• Participate in enzymatic acid, base, and metal catalysis</li> <li>• Important to regulation of blood clotting when <math>\gamma</math>-carboxylated (glutamate)</li> </ul>
Lysine	<ul style="list-style-type: none"> <li>• Interacts electrostatically with anionic amino acids and ligands</li> <li>• Binds cofactors via Schiff base</li> <li>• Stabilizes and protects proteins by forming isopeptide bonds</li> <li>• Stabilizes protein complexes by forming covalent crosslinks</li> <li>• Participates in enzymatic acid and base catalysis</li> <li>• Important to regulation of cellular processes by acetylation, ubiquitinylation, and SUMOylation</li> </ul>
Arginine	<ul style="list-style-type: none"> <li>• Interacts electrostatically with anionic amino acids and ligands</li> <li>• Participates in enzymatic catalysis by <math>pK_a</math> modulation and stabilization of anionic transition states</li> </ul>
Histidine	<ul style="list-style-type: none"> <li>• Appeared late in evolution</li> <li>• Binds metals covalently</li> <li>• Participates in enzymatic acid, base, and metal catalysis</li> </ul>
Aromatic amino acids	<ul style="list-style-type: none"> <li>• Appeared late in evolution</li> <li>• Form gates in ion channels and transporters</li> <li>• Important to ligand binding via van der Waals, nonpolar, hydrogen bonding, <math>\pi</math>-<math>\pi</math> and <math>\pi</math>-cations</li> <li>• UV light absorption (protein characterization in lab)</li> </ul>
Tyrosine	<ul style="list-style-type: none"> <li>• Important to regulation of protein and cellular functions via phosphorylation</li> <li>• Facilitates protein secretion, viral entry into cells and metal binding via sulfation</li> <li>• Participates in enzymatic acid-base, redox, and radical-based catalysis</li> </ul>
Tryptophan	<ul style="list-style-type: none"> <li>• Has the largest side chain of all amino acids</li> <li>• Has low frequency in proteins</li> <li>• Participates in electron transport</li> <li>• Fluorescent (lab characterization of conformational changes and ligand binding)</li> </ul>
